Abstract

Following the war, a significant number of people found themselves without shelter, forced to look for temporary accommodation in hotels or various guesthouses. Entire families with children were crammed into small rooms, which created difficulties in managing the daily routine. Finding temporary housing can be a challenging task, and our idea is to successfully deal with this dilemma.

Our platform will connect apartment owners who are willing to donate their properties to evacuees and people who remain homeless, looking for short-term rentals. The system will include a database of available properties, allowing filtering and sorting based on specific parameters.

Each property listing will provide detailed information about nearby amenities such as grocery stores, supermarkets, playgrounds and medical facilities. The system aims to encourage property owners to donate temporary housing through the creation of a competitive rating mechanism that strengthens and promotes social ties and contribution to the community. Feedback and ratings can be provided at the end of each hospitality experience, fostering a sense of community and gratitude. Through this innovative approach, our platform seeks to alleviate the housing crisis and enable a supportive environment for those in need. In the system it will be possible to receive offers according to the personal preferences of the evacuee and it will be possible to rate the owner of the property after the stay according to the hospitality experience.

1 INTRODUCTION

Our system serves as a platform for finding housing solutions for evacuees and individuals left without shelter for short periods. The platform enables property owners to efficiently and easily publish their listings, providing users with an advanced search and filtering experience to quickly find the most suitable accommodation for them.

1.1 Problem Description

Due to the war, many people have found themselves without shelter or displaced from their homes. Numerous property owners are eager to contribute to their community by renting out their properties as donations for those who have been displaced. This initiative allows property owners to extend a helping hand to those in need, providing temporary housing for those affected by the conflict.

1.2 Home link Motivation

By offering their properties for rent as a contribution, these property owners aim to support the community and provide assistance in any way they can. This initiative not only provides shelter for those affected by the conflict but also strengthens the sense of community.

1.3 Home Link Goals

Facilitating a streamlined process for evacuees to secure temporary housing during times of crisis is essential. Creating a user-friendly platform that connects evacuees with available rental properties emphasizes ease of use for both property owners and those seeking shelter. Enhancing the search experience for evacuees by providing a fast and efficient platform that precisely matches their specific housing requirements is also crucial. Implementing advanced search and filtering mechanisms allows evacuees to quickly find accommodations tailored to their preferences, such as location, size, and amenities. Furthermore, fostering a sense of community and encouraging property owners to contribute to the well-being of evacuees through their rental properties is vital. Developing a competitive rating system incentivizes property owners to offer their spaces for short-term use, emphasizing community engagement and contribution.

1.4 Overview of the Home Link Approach

The project provides free rental apartments for evacuees displaced by the war through a user-friendly website that connects them with property owners willing to offer their properties at no cost. The platform features advanced search and filtering mechanisms, allowing evacuees to find accommodations that meet their specific needs, while property owners can easily list and manage their properties. A rating system recognizes and incentivizes property owners' contributions, fostering a sense of community and support during difficult times.

1.4 Usage scenarios

Evacuees : A person seeking temporary housing turns to the "Home Link" platform after being forced to leave their home. They require a place that accommodates families and is pet-friendly, as they are not alone and have a pet. The user-friendly interface of "Home Link" allows them to efficiently filter and find accommodations that meet their specific needs. Features like instant notifications and direct messaging make it easy for them to communicate with potential hosts and secure a place in a timely manner.

A Property Owner Offering Space: A homeowner with extra space decides to help those in need of temporary shelter by listing their available rooms on "Home Link." They emphasize features such as extra bedrooms and a family-friendly environment in their listing. The platform efficiently matches them with individuals or families looking for accommodations that meet their criteria, simplifying the process of helping others. The property owner finds the platform helpful in managing bookings and appreciates receiving timely alerts about new applications, ensuring they can provide assistance effectively.

1.5 Home Link audience

The primary audience for the project includes evacuees displaced by the war who are in urgent need of temporary housing and property owners who are willing to offer their properties for free to support those in crisis.

2 TECHNOLOGICAL SURVEY

2.1 Programming Languages and Frameworks

For the development of the project, React is chosen as the primary framework. React is known for its efficiency in building interactive user interfaces and single-page applications. It allows for the creation of reusable UI components, which enhances development speed and maintainability. The declarative nature of React ensures that the UI remains consistent and predictable, which is crucial for a user-friendly platform that connects evacuees with property owners.

2.2 Database Management

The project utilizes MongoDB as the database solution. MongoDB, a NoSQL database, is selected for its flexibility in handling unstructured data and its ability to scale horizontally. This is particularly beneficial for a platform that needs to manage a diverse set of data, including property listings, user profiles, and search queries. MongoDB's schema-less nature allows for rapid iteration and evolution of the data model as the project grows and its requirements change.

2.3 Additional Technologies

To further improve the platform's functionality and user engagement, technologies such as RESTful APIs for seamless data communication and ****authentication mechanisms**** for secure user access are employed. These technologies contribute to a robust and scalable system capable of handling a large number of users and interactions effectively.

2 REQUIREMENTS AND SPECIFICATION

Functional requirements of the project are the necessary conditions that relate to the functionality of the system. **Non-functional requirements** of the project are requirements which do not relate to functionality but to aspects that influence the manner in which the functionality is provided.

Home Link functional requirements

3.1.1 User Registration and Authentication:

- The system should allow users to create accounts, providing necessary information for authentication.
- Users should be able to log in securely using credentials.

3.1.2 User Profiles:

- Each user, whether an evacuee or a property owner, should have a profile with editable personal information.
- Profiles should include relevant details such as contact information, preferences, and, for property owners, property details.

3.1.3 Property Listing:

- Property owners should be able to upload detailed information about their available accommodations, including capacity, amenities, and nearby facilities.
- The system should support image uploads to enhance property presentation.

3.1.4 Property Search and Reservation:

- Evacuees should be able to search for available properties based on criteria like location, capacity, and amenities.
- The system should provide a reservation feature allowing evacuees to book properties for specified durations.

3.1.5 Feedback and Rating System:

- Users, especially evacuees, should have the ability to provide feedback on their stay, including cleanliness, amenities, and overall satisfaction.
- Property owners should receive ratings based on tenant feedback, contributing to a community-driven reputation system.

3.1.6 Notification and Communication:

- The system should send automated notifications to users, informing them of reservation confirmations, feedback requests, and other relevant updates.
- An internal messaging system should facilitate communication between evacuees and property owners.

3.1.7 Reservation Management:

- Property owners should have a dashboard to manage reservations, including viewing upcoming bookings, confirming reservations, and marking property availability.

Home Link non-Functional requirements

The following is a list of non-functional requirements:

3.2.1 Performance:

- The system should be able to handle a scalable number of users and properties, ensuring optimal performance during peak usage times.
- Property search and reservation processes should be responsive, with low latency.

3.2.2 Scalability:

- The system architecture should support scalability to accommodate a growing number of users, properties, and concurrent transactions.
- Scaling mechanisms should be implemented to handle increased load gracefully.

3.2.3 Reliability:

- The system should have high availability, minimizing downtime for maintenance or unexpected issues.
- Data integrity should be maintained, and the system should be resilient to server failures.

3.2.4 Security:

- Secure authentication mechanisms should be implemented to protect user accounts and sensitive information.
- The system should adhere to industry-standard security practices to prevent unauthorized access and data breaches.

3.2.5 Usability:

- The user interface should be intuitive and user-friendly, catering to users with varying levels of technical expertise.
- Navigational elements should be clear, and the system should provide contextual guidance.

3.2.6 Compatibility:

- The system should be compatible with a variety of devices and browsers to ensure a seamless user experience.

3.2.7 Data Backup and Recovery:

- Regular backups of user data and system configurations should be performed to prevent data loss.
- The system should have mechanisms in place for quick data recovery in case of unforeseen events.

3.2.8 Regulatory Compliance:

- The system should comply with relevant data protection regulations and privacy laws.
- Adherence to legal standards and guidelines should be a priority in the system design and operation.

3.2.9 Response Time:

- The system should maintain acceptable response times for critical functions such as property search, reservation, and feedback submission.
- Users should experience minimal delays in accessing and interacting with the system.

Specification - the scope of the Home Link project

Our project connects evacuees with property owners offering free rental accommodations. The platform allows secure user registration and login, with profiles for both evacuees and property owners. Property owners can list detailed property information and images. Evacuees can search for properties based on criteria like location and amenities, and book them for specific durations. A feedback and rating system will enhance trust and community. Notifications and messaging will keep users informed and facilitate communication. Property owners can manage reservations through a dedicated dashboard.

Non-functional requirements ensure the system is scalable, reliable, secure, and user-friendly, with regular data backups and compliance with data protection regulations.

The Home Link approach

The proposed solution approach for the temporary shelter system encompasses a secure user authentication and registration system, allowing individuals like Shani and Eli to access the platform. The system facilitates property listing and search functionalities, ensuring evacuees can easily find suitable accommodations, while property owners, like Eli, can seamlessly upload and manage their listings. A robust reservation system, coupled with a comprehensive feedback and rating mechanism, enhances user experience. Personalized user profiles and dashboards, along with effective notification and communication features, contribute to a user-friendly interface.

4 THE ARCHITECTURE

To explain the architectures, we will introduce several models later on. These models will help illustrate data transfer methods, highlight the system's key features, and clarify the interactions between the system, users, and administrators.

Home Link Data

The system's database is managed using MongoDB. This database stores all relevant information, including user profiles, property details, and reservation data. MongoDB's flexibility and scalability ensure that the platform can efficiently handle the growing amount of data and user interactions, providing a reliable foundation for connecting evacuees with available accommodations.

The internal and external representations

- **Internal Representation**

The internal representation involves the backend infrastructure, including the MongoDB database for storing user profiles, property details, reservations, and feedback. It also includes server-side logic for authentication, data processing, and search algorithms.

- **External Representation**

The external representation consists of the user interface built with React, allowing users to create accounts, manage profiles, search for properties, and make reservations. It focuses on visual design, usability, and features like notifications and messaging to facilitate user interaction.

Initial start-up data

The initial start-up data refers to the foundational information and configurations required to launch and operate the Home Link platform effectively. This data includes:

1. User Accounts: Pre-created user accounts for testing purposes, including profiles for both evacuees and property owners.
2. Property Listings: Sample property listings to demonstrate the system's functionality, complete with details such as location, capacity, amenities, and images.
3. System Configuration: Settings and preferences that define how the system operates, including user roles, permissions, and security protocols.
4. Sample Reservations and Feedback: Example reservations and feedback entries to test and showcase the booking and rating systems.
5. Notification Templates: Predefined templates for automated notifications, such as reservation confirmations and feedback requests.

Home Link Processes

The Home Link platform integrates several key processes to provide a comprehensive and user-friendly experience for both evacuees and property owners.

- **User Registration and Authentication:** Users create accounts and log in securely.
- **Profile Management:** Users (evacuees and property owners) manage personal and property information.
- **Property Listing:** Owners upload and manage details of available accommodations.
- **Property Search and Reservation:** Evacuees search for and book properties based on specific criteria.
- **Feedback and Rating:** Users provide and view feedback on properties and stays.
- **Notification and Communication:** Automated notifications and messaging facilitate updates and communication between users.
- **Reservation Management:** Owners manage bookings and property availability through a dedicated dashboard.

Roles

Evacuees: Individuals seeking temporary housing due to displacement. They use the platform to find, book, and provide feedback on properties.

Property Owners: Individuals offering free accommodations to evacuees. They list and manage their properties, respond to bookings, and receive feedback.

These roles ensure the platform effectively connects those in need of housing with those offering support.

The life-cycle view of a system

The life-cycle view of the Home Link system includes planning and requirements gathering, where objectives and user needs are defined. This is followed by system design, developing the architecture and interface. Implementation involves coding and integrating components. Testing ensures the system meets requirements and is bug-free. Deployment makes the system accessible to users. During operation and maintenance, performance is monitored, and updates are made. Evaluation involves collecting user feedback for improvements. Eventually, the system is retired when it is no longer needed or replaced, ensuring proper data migration and decommissioning.

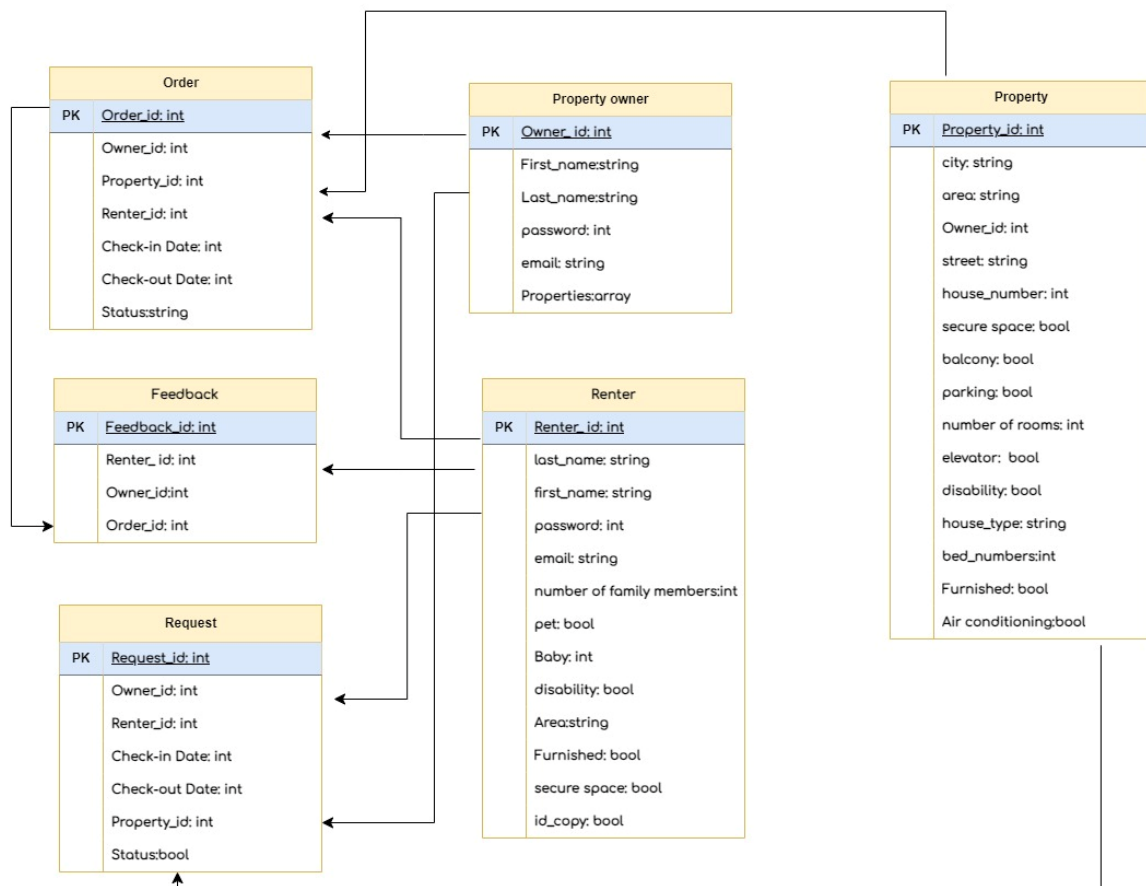

5 SYSTEM DESIGN

This section discusses the design of Home Link; it will explain the mapping of the architecture and its elements to the components that will implement and animate them.

Data components

The Home Link project has two major data entities: Users and Properties. User information is used for registration, authentication, and profile management. Property data, including details like location, capacity, amenities, and images, is retrieved from the database and displayed on the user interface, both in a list format and on a map, to facilitate easy search and reservation by evacuees.

Data Diagram:

Process components

The process components of the Home Link project include several key operations that ensure the system functions smoothly and efficiently:

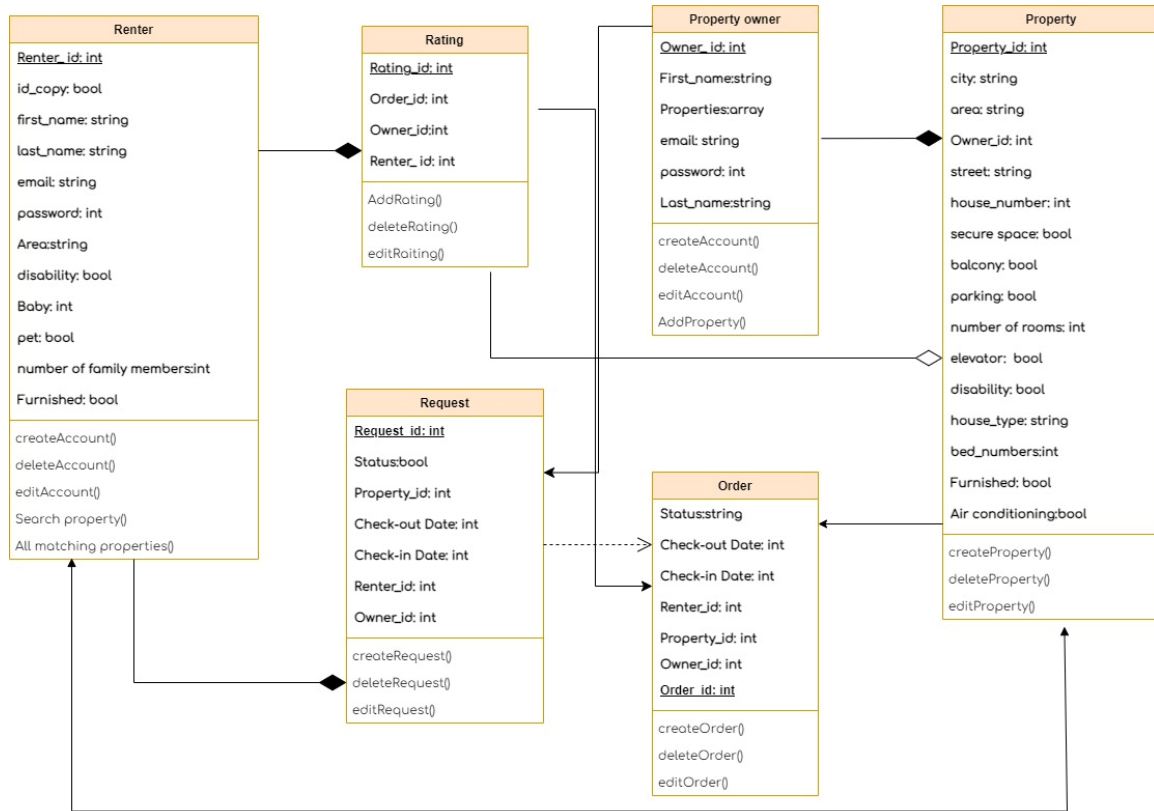

1. **User Registration and Authentication:** This process involves creating new user accounts, verifying identities, and enabling secure login for both evacuees and property owners.
2. **Profile Management:** Users can edit and update their profiles, including personal information and property details for owners.
3. **Property Listing:** Property owners upload and manage information about their available accommodations, including adding images and specifying amenities.
4. **Property Search and Reservation:** Evacuees search for properties based on criteria such as location and capacity, and make reservations for their preferred accommodations.
5. **Feedback and Rating:** Users provide feedback and ratings for properties, which helps maintain a reputation system for property owners.

Communication components (user-computer interaction)

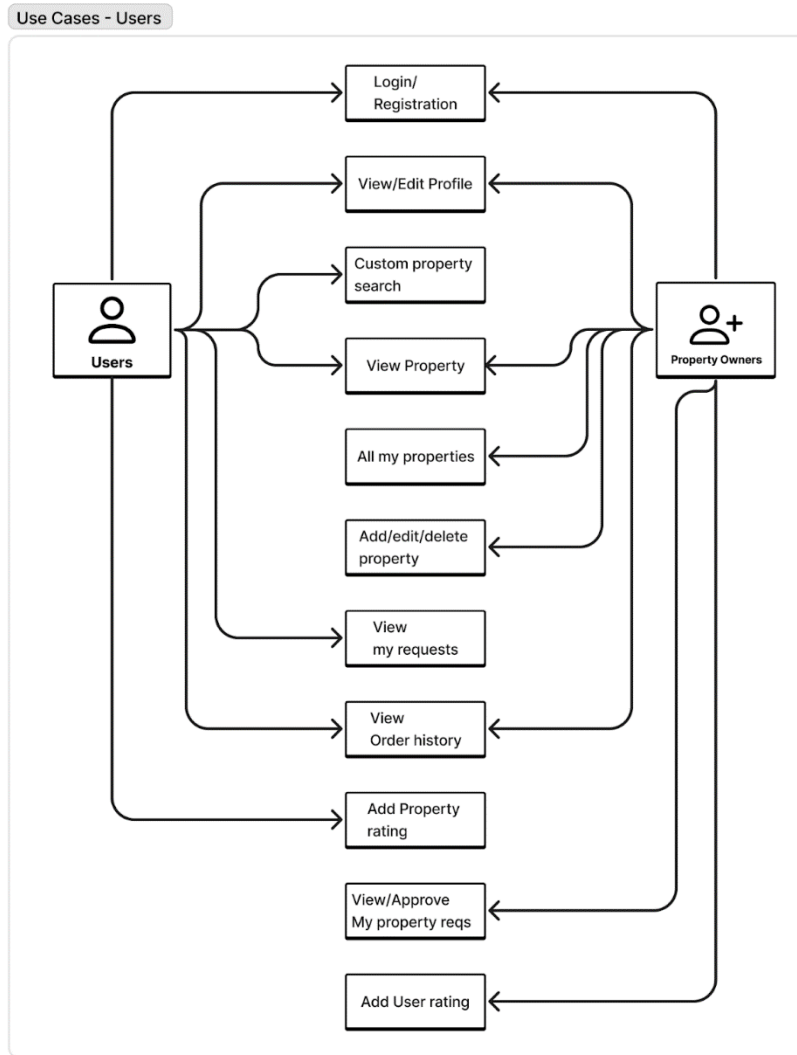

Interactions

The Home Link project employs a React-based web application to ensure smooth user-computer interaction. The user interface is clean and responsive, guiding users through registration, property search, and reservation processes with ease. Users can manage their profiles and update personal information via a user-friendly dashboard. Interactive search and filter tools allow evacuees to find properties that meet their specific needs, with results displayed in both list and map views. Detailed property pages provide comprehensive information, including descriptions and images. The reservation system enables easy booking with clear confirmation messages. Additionally, users can submit feedback and ratings, contributing to the platform's reputation system.

6 IMPLEMENTATION

The implementation of the Home Link project involves several key steps to build and deploy the platform effectively:

Frontend Development: Using React, the user interface is developed to be responsive and user-friendly. This includes creating components for user registration, profile management, property listing, search and filtering, and reservation processes.

Backend Development: A robust backend is built using server-side technologies that manage user authentication, data processing, and business logic. This includes integrating with MongoDB to store user profiles, property details, reservations, and feedback.

Database Management: MongoDB is configured to handle data storage and retrieval efficiently. The database schema is designed to accommodate user and property data, ensuring scalability and flexibility.

API Integration: RESTful APIs are developed to facilitate communication between the frontend and backend. These APIs handle requests for user actions such as logging in, searching for properties, booking accommodations, and submitting feedback.

Interfaces

This section will showcase the user interface of the web-based application Home Link, featuring screenshots of various GUI screens.

Development environment

Our development environment for the Home Link project is set up to make it easy for our team to work together. We use Visual Studio Code for coding, which works well with JavaScript and backend technologies. Git and GitHub help us manage version control and host our code, allowing the team to collaborate and keep track of changes. For the frontend, we build with React, using Create React App to set up our project. On the backend, we use Node.js and Express.js to build our server-side application. We store our data in MongoDB and manage it with tools like MongoDB Compass

Programming languages

For the Home Link project, we use a combination of programming languages to build a robust and efficient platform.

- **JavaScript**
- **HTML/CSS.**
- **Mongo DB**
- **React**

This combination of languages enables us to create a seamless, full-stack development environment that supports our project's goals and requirements.

Risk Management

- Inadequate Community Contribution:
Property owners may not actively contribute or may withdraw from the program.
Solution: Implement a competitive rating system to encourage positive contributions.
Recognize and reward property owners who consistently contribute.
- User Disputes:
Disputes between evacuees and property owners regarding bookings or property conditions.
Solution: Establish clear terms of use and guidelines.
- Verification of user information:
Citizens who will pretend to be evacuees in order to get a free "vacation".
Solution: Checking the residential address of the evacuees when booking the property in order to verify that they are indeed evacuees.

Exceptions Management

In our project, we encountered several challenging errors related to server connectivity and the synchronization of data between the front-end and back-end, as well as between orders and property owner updates. To effectively manage these issues, we implemented a comprehensive error alerting system.

We established mechanisms to detect errors and promptly alert the end users. Each error triggers an alert that specifies what the error is and whether the attempted process (like connecting to the server or syncing data) was successful or not. This method allows us to respond quickly to issues and keep users informed about the status of their interactions with the platform.

Furthermore, we enhanced our logging system to record details about each error, facilitating faster diagnosis and resolution. By keeping users aware of the system status through clear notifications, we improved their overall experience and ensured they were not left wondering about the outcomes of their actions.

This strategic approach to error management not only helped in maintaining the stability of the system but also built trust with our users by providing transparency and clear communication during error situations.

Versions Control

We managed our project using GitHub, a well-known version control platform. We used GitHub to track changes made to the code and performed numerous updates and commits over time. Each team member could view others' updates, contribute their changes, and collaborate efficiently. This approach helped us maintain a clear history of our project's development and ensured that all team members were always aligned with the latest versions of our work.

Project Management

In developing our team prioritized equitable distribution of responsibilities to ensure that each member could contribute effectively while supporting one another. We committed to a collaborative approach, where team members frequently worked together, both remotely and in-person, to maximize our collective skills and availability. Each member was allocated tasks that suited their strengths, yet everyone remained flexible, stepping in to assist others whenever needed. This approach not only enhanced our efficiency but also fostered a supportive environment, where team members felt valued and empowered. Regular meetings and collaborative sessions were key to our workflow, allowing us to share insights, resolve issues quickly, and make decisions collectively.

7 SYSTEM VALIDATION

Introduction

This report outlines the validation process and findings for our project, which aims to connect individuals with temporary housing solutions free of charge. The purpose of validation is to ensure that the platform addresses the needs of potential users and meets its goal of facilitating the process of finding temporary housing efficiently.

Validation's Description

The validation involved a group of users with diverse backgrounds, including students, professionals, and retired individuals, who were tasked with using the platform to simulate the experience of both housing seekers and property owners. The focus was on assessing the user interface, the effectiveness of the matching algorithm, and the overall functionality of the system.

Participants engaged with the platform by performing tasks such as creating profiles, searching for housing, and offering accommodations. This interaction provided valuable insights into the user-friendliness and practical utility of the platform.

Results

Most participants reported a positive experience, emphasizing the ease of navigation and the quick, intuitive matching process. They appreciated the platform's ability to streamline the search and connection process without any financial burden. Property owners found the platform efficient for listing their properties and managing communications with potential renters.

Conclusions

The validation process confirmed that the platform effectively meets its fundamental objectives by simplifying the temporary housing search for users. The insights gathered from general users have identified opportunities for enhancing functionality and user engagement. Future updates will focus on improving real-time interactions and expanding profile features to foster greater trust and efficiency. This validation has demonstrated the platform's potential to provide significant assistance in securing temporary housing, positioning it for future improvements based on user-centric feedback.

8 SUMMARY, EVALUATION, CONCLUSIONS AND FUTURE WORK

Summary

The Home Link project was launched with the mission to create a robust, user-friendly platform that connects individuals in need of temporary housing with property owners willing to provide accommodations at no cost. Recognizing the challenges faced by evacuees and others in transient situations, the platform aims to alleviate the hardship of finding safe, temporary housing by leveraging technology to match housing needs with available resources efficiently.

Evaluation and conclusions

Throughout the project, Home Link demonstrated substantial effectiveness in achieving its goals. The user interface is designed with simplicity and accessibility in mind, ensuring that users of all technological proficiencies can navigate and utilize the platform with ease. The sophisticated matching algorithm optimizes the pairing process based on location, availability, and user preferences, which has been well-received by both property owners and housing seekers.

Home Link

User feedback has been overwhelmingly positive, particularly appreciating the platform's ability to streamline the often-tedious process of securing temporary housing. Nonetheless, during the evaluation phase, users also identified several areas needing enhancement. These include the need for more immediate updates on housing availability and the ability for users to update their preferences and availability in real-time. Furthermore, users suggested improving the security measures and depth of user profiles to foster a safer and more trusting community.

Future work

For future developments, **Home Link** is set to focus on a few key areas to enhance user experience and functionality:

1. **Real-Time Updates:** Implementing a real-time notification system to alert users immediately when suitable housing options become available or when there are changes in the listing status.
2. **Enhanced User Profiles:** Developing deeper, more comprehensive user profiles that include verified personal information, past usage history, and user reviews. This will not only increase trust among users but also help in making more informed matching decisions.
3. **Mobile Optimization:** Given the increasing reliance on smartphones for internet access, optimizing the platform for mobile devices is crucial. This will involve improving the mobile interface and ensuring that all features are fully functional on various devices and operating systems.
4. **Security Features:** Enhancing security measures, including data encryption and secure communication channels, to protect user data and privacy.

These initiatives are designed to not only improve the functionality of the **Home Link** platform but also to ensure it remains a reliable, secure, and efficient resource for those in need of temporary housing.
